Summary of report document

This report document contains the pseudocode of the algorithm and three screenshots. One screenshot is of the group members and the rest are snapshots of the code executing.

Pseudocode:

Algo Verify

1) Declare a vector variable result

2) Taking 2 instructions (Consider 1 as simple instruction and other as block instruction)

a. 1st instruction loop:

```
for (int i = 0; i < blockInstructionSize - 1; i++)
```

```
// getting the output variable
```

```
char simpleInstructionOutput = BlockInstructions[i][0];
```

```
// getting input variables
```

```
set<char> simpleInstructionInputVariables = getInputVariables(BlockInstructions[i]);
```

b. 2nd instruction loop:

```
for (int j = i + 1; j < blockInstructionSize; j++)
```

```
// getting the output variables
```

```
char blockInstructionOutputVariable = BlockInstructions[j][0];
```

```
// getting input variables
```

```
set<char> blockInstructionInputVariables = getInputVariables(BlockInstructions[j]);
```

3) Check if ()

a. Instructions are !flowdependent

b. Instructions are !antidependent

c. Instructions are !outputdependent

4) Push the parallel instructions to result if checks pass

```
result.push_back(parallelInstrucitonsSet);
```

5) return result;

Algo Calculate

1) Declare a vector variable result

2) Taking 2 instructions (1 simple instruction and 1 block instruction)

a. Block instruction loop:

```
for (int i = 0; i < blockInstructionSize; i++)
```

```
// getting the output variable
```

```
char blockInstructionOutputVariable = BlockInstructions[i][0];
```

```
// getting the input variable
```

```
set<char> blockInstructionInputVariables = getInputVariables(BlockInstructions[i]);
```

3) Check if ()

a. Instructions are !flowdependent

b. Instructions are !antidependent

c. Instructions are !outputdependent

4) Push the parallel instructions to result

```
result.push_back(parallelInstrucitonsSet);
```

5) return result;

Two snapshots of code executing for some two distinct values of N:

INPUT:

Instruction:

$d = b + (c - d / e)$

Block:

$b = b * c$

$d = c - a$

$a = a + b * c$

```
DataDependency
Running algo verify...
The pairs of instructions that can be executed in parallel are: 1
Printing the set of Parallel Instructions:
b = b * c          d = c - a

Running algo calculate...
The pairs of instructions that can be executed in parallel are: 1
Printing the set of Parallel Instructions:
d = b + (c - d / e)    a = a + b * c
```

INPUT:

Block:

$a = a * b * c$

$c = c - a$

$a = a + b * c$

```
DataDependency
Running algo verify...
The pairs of instructions that can be executed in parallel are: NONE
```
